Listing Of Claims

Claims 1-55 (Canceled)

56. (new) A method for testing semiconductor components on a substrate comprising:

providing a switching network;

applying test signals through the switching network to the components on the substrate; and

controlling the test signals using the switching network to perform a selected test on each component on the substrate.

- 57. (new) The method of claim 56 wherein the selected test comprises functionality testing.
- 58. (new) The method of claim 56 wherein the selected test comprises parametric testing.
- 59. (new) The method of claim 56 wherein the selected test comprises burn-in testing.
- 60. (new) The method of claim 56 wherein the substrate comprises a wafer and the components comprise semiconductor dice.
- 61. (new) The method of claim 56 wherein the substrate comprises a panel and the components comprise semiconductor packages.
- 62. (new) The method of claim 56 wherein the substrate comprises a leadframe and the components comprise semiconductor packages.

63. (new) A method for testing semiconductor components on a substrate comprising:

providing a switching network;

applying burn-in test signals through the switching network to the components on the substrate; and

electrically isolating at least one component on the substrate during the applying step using the switching network.

- 64. (new) The method of claim 63 wherein the applying step is performed using a carrier.
- 65. (new) The method of claim 64 wherein the substrate comprises a panel and the carrier configured to hold the panel in a burn-in oven.
- 66. (new) The method of claim 64 wherein the substrate comprises a leadframe and the carrier is configured to hold the leadframe in a burn-in oven.
- 67. (new) The method of claim 64 wherein the switching network is contained on an interconnect in the carrier configured to electrically engage the components.
- 68. (new) The method of claim 67 wherein the switching network comprises a die or active electrical switching devices on the interconnect.
- 69. (new) The method of claim 63 further comprising applying parametric test signals through the switching network prior to the electrically isolating step.
- 70. (new) A method for testing semiconductor components on a substrate comprising:

providing a carrier configured to hold the substrate; providing a switching network on the carrier;

applying test signals through the switching network to the components; and

controlling the test signals using the switching network to perform a selected test on the components.

- 71. (new) The method of claim 70 wherein the carrier includes an interconnect for electrically engaging the components and the switching network is contained on the interconnect.
- 72. (new) The method of claim 70 wherein the test signals are configured to perform functionality testing of the components.
- 73. (new) The method of claim 70 wherein the test signals are configured to perform burn-in testing of the components.
- 74. (new) The method of claim 70 wherein the test signals are configured to perform functionality testing and burn-in testing of the components.
- 75. (new) The method of claim 70 wherein the substrate comprises a wafer, a panel, a leadframe or a module.
- 76. (new) The method of claim 70 wherein the switching network comprises a die on the carrier.
- 77. (new) A system for testing semiconductor components on a substrate comprising:
 - a carrier configured to hold the substrate;
- an interconnect on the carrier configured to electrically engage the components held by the carrier; and

- a switching network on the carrier configured to selectively control applying of test signals through the interconnect to the components.
- 78. (new) The system of claim 77 wherein the substrate comprises a wafer, a panel, a leadframe or a module.
- 79. (new) The system of claim 77 wherein the carrier comprises a base for mounting the interconnect, a cover for holding the substrate, and a force applying mechanism for biasing the substrate and the interconnect together.
- 80. (new) The system of claim 77 wherein the carrier comprises an alignment member configured to align the substrate on the carrier.
- 81. (new) The system of claim 77 wherein the substrate comprises a wafer and the components comprise semiconductor dice.
- 82. (new) The system of claim 77 wherein the substrate comprises a panel and the components comprise semiconductor packages.
- 83. (new) The system of claim 77 wherein the substrate comprises a leadframe and the components comprise semiconductor packages.
- 84. (new) The system of claim 77 wherein the carrier is configured for placement in a burn-in oven and the test signals include burn in test signals.
- 85. (new) A system for testing semiconductor components on a substrate comprising:

- a testing apparatus comprising an interconnect configured to electrically engage the components on the substrate;
- a tester in electrical communication with the interconnect configured to generate and analyze test signals for testing the components; and
- a switching network on the testing apparatus in electrical communication with the interconnect configured to control test signals applied through the interconnect to the components.
- 86. (new) The system of claim 85 wherein the testing apparatus comprises a wafer prober.
- 87. (new) The system of claim 85 wherein the testing apparatus comprises a carrier configured to hold the substrate.
- 88. (new) The system of claim 85 wherein the testing apparatus comprises a tester and the switching network is configured to expand resources of the tester by transmitting read test signals from selected groups of components.
- 89. (new) The system of claim 85 wherein the switching network comprises a plurality of active electrical switching devices.
- 90. (new) The system of claim 85 wherein the substrate comprises a wafer and the components comprise dice on the wafer.
- 91. (new) The system of claim 85 wherein the substrate compress a leadframe and the components comprise packages on the leadframe.

- 92. (new) The system of claim 85 wherein the substrate comprises a panel and the components comprise packages on the panel.
- 93. (new) A system for testing semiconductor components on a substrate comprising:

an interconnect comprising a plurality of interconnect contacts configured to electrically engage the components;

a switching network in electrical communication with the interconnect contacts;

a tester configured to transmit test signals through the switching network and the interconnect to the components;

the switching network configured to multiply and selectively transmit the test signals, to electrically isolate non-functional components and to read test signals from selected groups of components.

- 94. (new) The system of claim 93 further comprising a carrier containing the interconnect configured to hold the substrate.
- 95. (new) The system of claim 94 wherein the carrier is configured for placement in a burn-in oven.
- 96. (new) The system of claim 93 wherein the switching network comprises a die on the interconnect.
- 97. (new) The system of claim 93 wherein the interconnect comprises a semiconductor material and the switching network comprises active electrical devices in the material.
- 98. (new) The system of claim 93 wherein the components comprise dice and the substrate comprises a wafer.

- 99. (new) The system of claim 93 wherein the components comprise packages and the substrate comprises a leadframe or a panel.
- 100. (new) The system of claim 95 further comprising a wafer prober containing the interconnect configured to handle the substrate.
